Education

VNUHCM – University of Science — Ho Chi Minh City, Vietnam
Bachelor of Information Technology — **GPA: 3.6/4.0** — *Sep. 2023 – Aug. 2027*

Certifications & Awards

ICPC Vietnam Provincial Programming Contest | *Provincial Qualifier* — Oct. 2024
HCMUS-CTF 2024 | *Consolation Prize* — Oct. 2024
IELTS: 6.0 — Mar. 2023

Experience

Software Engineer Intern — Aug. 2026 – Current
Grab — *Ho Chi Minh City, Vietnam*

Closed Mex Experience — Sep. 2026 – Current

- Implemented two mobile tickets for the Closed MEX Experience workstream, delivering Order for later shimmer and Basket CTA.

Software Engineer Intern — Jan. 2026 – Jun. 2026
i-stech — *Ho Chi Minh City, Vietnam*

Social Analytics Platform — Apr. 2026 – Jun. 2026

- Built an analytics dashboard using **React** and **Chart.js**, reducing chart loading and rendering time by **60%** through client-side rendering and data-processing optimizations across a dataset containing over **28 million rows**
- Reduced CSV export time by **70%** (13s to 4s) for exports sourced from a **42-million-row PostgreSQL table** using LRU caching and proactive cache warming, avoiding repeated database queries for identical export requests

Project Execution Platform (PEP) — Jan. 2026 – May 2026

- Built refund workflows for **Stripe and bank-transfer** payments using **idempotency keys** and **optimistic locking** to prevent duplicate processing under concurrent requests while correctly updating customer balances and pending invoices
- Automated the billing lifecycle through background jobs for contract-expiration checks, **Stripe webhook** processing, and database reconciliation, eliminating over **10 hours per week** of manual tracking and data entry

Projects

Authlyn — Apr. 2026 – Jun. 2026
Personal Project — ***GitHub***

- **Technologies**: Spring Boot 4.0, Spring Security, React, PostgreSQL, Redis
- Fixed a concurrent refresh-token race condition using **pessimistic locking**, preventing reuse-detection bypass under parallel requests
- Replaced an unbounded `ConcurrentHashMap` in the rate limiter with a TTL-evicted **Caffeine LRU cache**, preventing heap exhaustion under IP-spoofed request floods

Multi-Account Linker — Aug. 2026
Personal Project | *Go, JSONL, standard library* — *Completed*

- Built deterministic batch clustering and monotonic streaming assignments over account evidence, using a shared Go engine and JSONL interfaces.
- On the provided **100-account labeled sample**, measured **100% pair precision**, **81.3% pair recall** (89.7% F1), recovered both fraud rings (2/2), and recorded zero verified-distinct violations.

Technical Skills

Languages: Jsbs, Go, Python
Frameworks: Spring Boot, Spring Security, Next.js, React, Angular, FastAPI
Databases: PostgreSQL, Redis
Cloud & DevOps: Docker, GitHub Actions, Railway
Technologies: REST APIs, JWT, OAuth2, Stripe, Supabase, k6
